## S1 General procedures

## S1.1 Reagents and solvents

N -heterocycles were purchased from commercial suppliers and used without further purification. Anhydrous solvents were dried using a Solvent Purification System (SPS M BRAUM) or purchased from commercial suppliers degassed and stored over molecular sieves. Solvents used in catalytic experiments were deoxygenated using the freeze-pump-thaw methodology and kept under an atmosphere of nitrogen.

## S1.2 Instrumentation

Nuclear magnetic resonance (NMR) spectra were recorded on Bruker spectrometers operating at 300 or $400 \mathrm{MHz}\left({ }^{1} \mathrm{H} N M R\right)$ and 75 or $100 \mathrm{MHz}\left({ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}\right.$ ), respectively, and referenced to $\mathrm{SiMe}_{4}(\delta$ in ppm and $J$ in Hertz). NMR spectra were recorded at room temperature with the appropriate deuterated solvent. Electrospray mass spectra (ESI-MS) were recorded on a Micromass Quatro LC instrument; nitrogen was employed as drying and nebulizing gas. UV-visible absorption spectra were recorded on a Thermo Evolution 600 spectrophotometer. Emission spectra were recorded on a Horiba Fluorolog Jobin Yvon Inc spectrometer using dry and degassed methanol. The photocatalytic reactions were carried out in a homemade photoreactor (see below). The setup has a fan, magnetic stirrer, Schlenk flask connected to a bubbler filled with mineral oil, stirring bar and two 50W blue LEDs ( 455 nm ) lamps (Prilux). All hydrogenation reactions were set up in a 100 mL stainless steel high-pressure reactor. GC analyses were obtained on a Shimadzu GC-2010 apparatus equipped with a FID detector, and using a Teknokroma column (TRB-5MS, $30 \mathrm{~m} \times 0.25 \mathrm{~mm} \times 0.25 \mu \mathrm{~m}$ ). Molecular hydrogen was detected using a quadrupole mass spectrometer equipment (Omnistar GSD 32003 from PFEIFFER VACUUM).

## SUPPORTING INFORMATION

Intermediates used for the synthesis of MIC-ligands (N-phenylpropiolamide a, 1,3-bis(2,4,6-trimethylphenyl)triaz-1-ene $\mathbf{b}$ and $t$-butyl-hypochloride) were prepared following reported methods. ${ }^{1-3}$ Pyridine-2-carboxylic acid phenylamide HL, ${ }^{4}$ and the $\mathbf{I r}(\mathrm{III})$ metal complexes III, ${ }^{5} \mathbf{I V},{ }^{6} \mathbf{V},{ }^{7} \mathbf{V I},{ }^{8} \mathbf{V I I},{ }^{9}$ and VIII, ${ }^{10}$ were prepared according to reported procedures.

S2.1 Synthesis of triazolium salt [ $\left.\mathrm{H}_{2} \mathrm{~L}\right] \mathrm{PF}_{6}$.

Synthesis of [[ $\left.\mathrm{H}_{2} \mathrm{~L}\right] \mathrm{PF}_{6}$ : To a 250 mL Schlenk flask containing a N -phenylpropiolamide ( $1.00 \mathrm{~g}, 6.8$

[ $\mathrm{H}_{2} \mathrm{~L}$ ] $\mathrm{PF}_{6}$ mmol ), b 1,3-bis(2,4,6-trimethylphenyl)triaz-1-ene ( $1.3 \mathrm{eq}, 2.52 \mathrm{~g}, 8.95 \mathrm{mmol}$ ) and $\mathrm{KPF}_{6}(1.5 \mathrm{eq}, 1.90 \mathrm{~g}, 10.3 \mathrm{mmol})$ was added dry dichloromethane ( 100 mL ) under nitrogen and cooled to $-78^{\circ} \mathrm{C}$. Then, ${ }^{\mathrm{t}} \mathrm{BuOCl}(0.47 \mathrm{~mL}, 0.62 \mathrm{mmol})$ was added dropwise and the solution stirred overnight while allowing warming up to room temperature. The resulting red-brown solution was filtered using a frit funnel to remove a fine precipitate. The volatiles were then removed under reduced pressure to afford a light red powder, which was washed several times with hexane and diethyl ether to afford an ochre powder. $2.04 \mathrm{~g}, 53 \%$ yield. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300\right.$ $\mathrm{MHz}, \mathrm{ppm})$ : $\delta 9.71$ (br, $1 \mathrm{H}, \mathrm{NH}$ ), 9.29 ( $\mathrm{s}, 1 \mathrm{H}, \mathrm{CH}_{\mathrm{tr}}$ ), 7.74 (d, $\mathrm{JHH}_{\mathrm{H}}=7.9 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{\text {arom }}$ ), 7.30 (t, $\mathrm{J}_{\mathrm{H}}=8$ $\mathrm{Hz}, 2 \mathrm{H}, \mathrm{CH}_{\text {arom }}$ ), 7.15 (t, JHH $=7.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{\text {arom }}$ ), 7.11 (s, $2 \mathrm{H}, \mathrm{CH}_{\text {arom }}$ ), $7.10\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{\text {arom }}\right.$ ), 2.41 (s, $3 \mathrm{H}, \mathrm{CH}_{3}$ ), $2.40\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 2.18\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{CH}_{3}\right), 2.12\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}, \mathrm{ppm}\right) \delta$ $150.5,143.5,142.9,138.2,136.5,134.3,134.2,132.6,131.1,131.0,130.3,130.0,129.2,121.0,21.5$, 21.4, 17.4, 17.3; HRMS ESI-TOF-MS (positive mode): [M-PF $\left.{ }_{6}\right]^{+} 425.2336$; calc. 425.2341, $\varepsilon_{r}$ : 1.2 ppm.

S2.2 Synthesis of iridium complexes

Scheme S2 Synthesis of neutral and cationic MIC-Ir'II complexes I-II.

Synthesis of [IrCp*Cl(C-N)] I: Under inert atmosphere, 1,3-dimesityl-4-(phenylcarbamoyl)-1H-1,2,3-triazol-3-ium hexafluoro phosphate(V) ( $0.228 \mathrm{~g}, 0.4 \mathrm{mmol}$ ) [ $\left.\mathrm{H}_{2} \mathrm{~L}\right] \mathrm{PF}_{6}, \mathrm{Ag}_{2} \mathrm{O}(0.092 \mathrm{~g}$,

I $0.4 \mathrm{mmol}),\left[I r\left\{\eta^{5}-\mathrm{C}_{5}\left(\mathrm{CH}_{3}\right)_{5}\right\} \mathrm{Cl}_{2}\right]_{2}(0.159 \mathrm{~g}, 0.2 \mathrm{mmol})$ and tetramethyl ammonium chloride ( $0.131 \mathrm{~g}, 1.2 \mathrm{mmol}$ ) were suspended in dry acetonitrile ( 7 mL ), and stirred for 18 hours at $60{ }^{\circ} \mathrm{C}$ in the absence of light under nitrogen. The reaction mixture was filtered over celite and washed with acetonitrile ( $2 \times 20 \mathrm{~mL}$ ). The volatiles were removed under reduced pressure. Dichloromethane was added to the crude mixture and filtered over celite again and washed with dichloromethane. The volatiles were removed under reduced pressure to afford the entitle compound as a brown-orange solid, 0.298 g , 95\% yield.
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, 300 \mathrm{~K}$ ) $\delta 7.44$ (dd, $J=8.4,1.3 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{\text {arom }}$ ), $7.24\left(\mathrm{t}, J_{\mathrm{HH}}=8.0 \mathrm{~Hz}, 2 \mathrm{H}\right.$, $\mathrm{CH}_{\text {arom }}$ ), 7.12 (s, $1 \mathrm{H}, \mathrm{CH}_{\text {arom }}$ ), $7.08\left(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CH}_{\text {arom }}\right), 7.03\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{\text {arom }}\right), 6.97(\mathrm{~s}, 1 \mathrm{H}), 2.41\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$, 2.40 (s, 3H, CH3), 2.34 (s, 3H, CH3), $2.20\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right.$ ), 2.12 ( $\mathrm{s}, 6 \mathrm{H}, \mathrm{CH}_{3}$ ), 1.94 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{CH}_{3}$ ), 1.19 ( s , $15 \mathrm{H}, \mathrm{Cp}^{*} \mathrm{CH}_{3}$ ); ${ }^{13} \mathrm{C}$ HRMS ( $100 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, 300 \mathrm{~K}$ ) $\delta 163.2,149.9,149.7,148.2,141.6,141.3,137.4$, $136.1,135.9,135.7,134.3,131.7,130.2,129.5,129.4,129.3,128.1,127.9,124.3,89.2,30.3,21.5$, 21.4, 19.1, 18.3, 17.9, 17.7, 9.0. HRMS ESI-TOF-MS (positive mode): [M-CI] ${ }^{+} 751.2982$; calc. 751.2990, $\varepsilon_{r}$ : 1.1 ppm .

Synthesis of [IrCp* $\left.\left(\mathbf{N C C H}_{3}\right)(\mathbf{C}-\mathbf{N})\right] O T f$, II: Metal complex II was prepared by adapting a reported method in literature. ${ }^{11}$ To a dichloromethane $(15 \mathrm{~mL})$-acetonitrile $(2 \mathrm{~mL})$ solution of I ( $0.1 \mathrm{~g}, 0.127 \mathrm{mmol}$ ) was added AgOTf ( $0.033 \mathrm{~g}, 0.127 \mathrm{mmol}$ ) at room temperature. After stirring for 30 min , the mixture was filtered through a Celite pad and the filtrate was evaporated under vacuum. The resulting crude mixture was redissolved with 20 mL of dichloromethane and the solution was again filtered through a Celite pad to completely remove AgCl . The solution was evaporated and further dried under vacuum overnight to afford II as a brown powder ( $0.091 \mathrm{~g}, 76 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, 300 \mathrm{~K}$ ) $\delta 7.26$ (t, $\mathrm{JHH}=7.7 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{\text {arom }}$ ), 7.12 (s, $2 \mathrm{H}, \mathrm{C} H_{\text {Mes }}$ ), 7.07 (t, $\mathrm{JHH}=7.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{\text {arom }}$ ), 7.01 (s, H, CHarom), 6.93 (d, $\mathrm{JHH}=7.8 \mathrm{~Hz}, 1 \mathrm{H} \mathrm{CH}_{\text {arom }}, 2 \mathrm{H}$, $\mathrm{CH}_{\text {Mes }}$ ), 2.40 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{CH}_{3}$ ), 2.34 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{CH}_{3}$ ), $2.14\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right.$ ), 2.12 ( $\mathrm{s}, 6 \mathrm{H}, \mathrm{CH}_{3}$ ), 1.96 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{CH}_{3}$ ), 1.19 (s, 15H, $\mathrm{Cp}^{*} \mathrm{CH}_{3}$ ); ${ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, 300 \mathrm{~K}$ ) $\delta$ 164.0, 150.4, 149.1, 146.4, 141.8, 141.6, $136.3,135.5,135.2,131.5,130.1,130.0,129.7,129.4,128.8,127.0,124.3,90.0,30.3,21.5,21.5,18.7$, 18.0, 17.8, 17.6, 8.62; HRMS ESI-TOF-MS (positive mode): [M] ${ }^{+} 751.2988$; calc. 751.2990, $\varepsilon_{r}: 0.3 \mathrm{ppm}$; $[\mathrm{M}+\mathrm{MeCN}]^{+} 792.3235$.

Scheme S3 Synthesis of neutral and cationic Py-Ir"II complexes III-IV.

Synthesis of [IrCp* $\mathbf{C l}(\mathbf{N}-\mathbf{N})]$, III: Complex III was prepared by following a reported method in the

III literature. ${ }^{5}$ Pyridine-2-carboxylic acid phenylamide HL’ ( $0.2 \mathrm{~g}, 1.00 \mathrm{mmol}$ ) was added to a stirred suspension of $\left[\mathrm{r}\left\{\mathrm{n}^{5}-\mathrm{C}_{5}\left(\mathrm{CH}_{3}\right)_{5}\right\} \mathrm{Cl}_{2}\right]_{2}(0.40 \mathrm{~g}, 0.50 \mathrm{mmol})$ in ethanol ( 30 mL ) at $95{ }^{\circ} \mathrm{C}$. After 30 min , ammonium hexafluorophosphate ( $0.40 \mathrm{~g}, 2.45 \mathrm{mmol}$ ) was added and the mixture was stirred at $95^{\circ} \mathrm{C}$ for 4 days. The solvent was evaporated, and the residue dissolved in dichloromethane ( 50 mL ), washed with water ( $2 \times 20$ mL ), brine ( 20 mL ), dried over sodium sulfate, and evaporated to afford the pure compound as an orange solid $0.48 \mathrm{~g}, 86 \%$ yield. ${ }^{1} \mathrm{H} \mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}, 300 \mathrm{~K}\right) ~ \delta$ 8.56 (ddd, $J_{H H}=5.6,1.6,0.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{\text {arom }}$ ), $8.14\left(\mathrm{~d}, \mathrm{JHH}=7.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{\text {arom }}\right.$ ), 7.90 ( $\mathrm{m}, 1 \mathrm{H}, \mathrm{CH}$ arom ), $7.64\left(\mathrm{~d}, \mathrm{~J}_{\mathrm{HH}}=7.3 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{\text {arom }}\right.$ ), 7.48 (ddd, $\mathrm{J}_{\mathrm{HH}}=7.4,5.5,1.6 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{\text {arom }}$ ), 7.30 ( $\mathrm{m}, 2 \mathrm{H}, \mathrm{CH}_{\text {arom }}$ ), 7.08 (ddt, $J_{H H}=8.6,7.0,1.2 \mathrm{~Hz} 1 \mathrm{H}, \mathrm{CH}_{\text {arom }}$ ), $1.39\left(\mathrm{~s}, 15 \mathrm{H}, \mathrm{Cp}^{*} \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right.$, ppm) ठ 168.6, 155.6, 149.8, 148.2, 138.6, 128.1, 127.5, 127.0, 126.3, 124.3, 86.7, 8.4; HRMS ESI-TOF-MS (positive mode): $[\mathrm{M}+\mathrm{H}]^{+} 561.1281$; calc. 561.1277, $\varepsilon_{r}: 0.7 \mathrm{ppm}$.

Synthesis of $\left[\operatorname{IrCp}{ }^{*}\left(\mathbf{N C C H}_{3}\right)(\mathbf{N}-\mathbf{N})\right] O T f$, IV: Metal complex IV was prepared by adapting a reported

IV method in literature. ${ }^{6}$ To a dichloromethane $(15 \mathrm{~mL})$-acetonitrile $(2 \mathrm{~mL})$ solution of III ( $0.207 \mathrm{~g}, 0.370 \mathrm{mmol}$ ) was added AgOTf ( $0.095 \mathrm{~g}, 0.370 \mathrm{mmol}$ ) at room temperature. After stirring for 30 min , the mixture was filtered through a Celite ${ }^{\circledR}$ pad and the filtrate was evaporated under vacuum. The resulting crude mixture was redissolved with 20 mL of dichloromethane and the solution was again filtered through a Celite pad to completely remove AgCl . The solution was evaporated and further dried under vacuum overnight to afford IV as a yellow powder ( $0.195 \mathrm{~g}, 74 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, 400 \mathrm{~K}$ ) $\delta 8.68\left(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}_{\mathrm{HH}}=5.5 \mathrm{~Hz}, \mathrm{CH}_{\text {py }}\right), 7.82(\mathrm{t}$, $\left.J_{H H}=7.6 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{\text {py }}\right), 7.72\left(\mathrm{~d}, J_{H H}=7.6 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{\text {py }}\right), 7.51\left(\mathrm{t}, 1 \mathrm{H}, \mathrm{J}_{\mathrm{HH}}=6.6 \mathrm{~Hz}, \mathrm{CH}_{\text {arom }}\right), 7.23$ (dt, $J_{H H}=7.8 \mathrm{~Hz}, 4 \mathrm{HCH}$ arom ), $7.10\left(\mathrm{t}, 1 \mathrm{H}, J_{\mathrm{HH}}=7.2 \mathrm{~Hz} \mathrm{CH}_{\text {arom }}\right.$ ), $1.32\left(\mathrm{~s}, 15 \mathrm{H}, \mathrm{Cp}^{*} \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C} \mathrm{NMR}(100 \mathrm{MHz}$, $\left.\mathrm{CD}_{2} \mathrm{Cl}_{2}, 300 \mathrm{~K}\right) \delta 169.8,154.7,151.0,148.0,140.1,133,3,128.7,128.5,127.0,126.2,125.2,122.7$, 119.5, 87.1(Cp*), 8.6 (Cp*); HRMS ESI-TOF-MS (positive mode): [ $M$ - OTf - $\left.\mathrm{NCCH}_{3}\right]^{+} 525.1526$; calc. 525.1519, $\varepsilon_{r}: 1.3$ ppm.

Synthesis of [IrCp*H(C-N)], IX: To an Schlenk containing the iridium complex I (1 eq., $0.079 \mathrm{~g}, 0.1$
 mmol ) dissolved in 3 mL of toluene was added portion wise $\mathrm{NaBH}_{4}$ ( 10 equiv. $0.038 \mathrm{~g}, 1 \mathrm{mmol})$. The reaction mixture was stirred for the period of 1 hour at room temperature. Then 3 mL of methanol were gently added. Once the effervescence has ceased, the volatiles were removed under reduced pressure. Toluene was IX added to the solid residue and filtered via cannula filtration. The filtrate was dried under vacuum to generate a yellow-orange solid. Yield $83 \%$.

## Experimental

A single crystal of $\mathrm{C}_{38} \mathrm{H}_{43} \mathrm{D}_{4} \mathrm{IrN}_{4} \mathrm{O}_{2}$ (Ir-H complex) was mounted on a MicroMount® polymer tip (MiteGen) in a random orientation. Data collection was performed on a SuperNova, Dual, Cu at home/near, Atlas diffractometer. The crystal was kept at 200.00(14) K during data collection. Using Olex2 [1], the structure was solved with the SHELXS [2] structure solution program using Direct Methods and refined with the SHELXL [3] refinement package using Least Squares minimisation.

## Crystal structure determination of Ir-H.

Crystal Data for $\mathrm{C}_{38} \mathrm{H}_{43} \mathrm{D}_{4} \mathrm{IrN}_{4} \mathrm{O}_{2}(M=788.02 \mathrm{~g} / \mathrm{mol})$ : monoclinic, space group $\mathrm{P}_{2} / \mathrm{c}$ (no. 14), $a=$ 13.3416(2) $\AA, b=17.0392(3) \AA, c=15.4121(3) \AA \AA, \beta=94.170(2)^{\circ}, V=3494.36(11) \AA^{3}, Z=4, T=$ 200.00 (14) $\mathrm{K}, \mu(\mathrm{Cu} \mathrm{K} \mathrm{\alpha})=7.686 \mathrm{~mm}^{-1}$, Dcalc $=1.494 \mathrm{~g} / \mathrm{cm}^{3}, 30776$ reflections measured $\left(7.746^{\circ} \leq 2 \Theta\right.$ $\leq 133.2^{\circ}$ ), 6170 unique ( $R_{\text {int }}=0.0359, R_{\text {sigma }}=0.0251$ ) which were used in all calculations. The final $R_{1}$ was 0.0272 (I $>2 \sigma(\mathrm{I})$ ) and $w R_{2}$ was 0.0714 (all data).

## S3 Photocatalytic dehydrogenation reactions

Photocatalytic dehydrogenation experiments were performed in a 12 mL Schlenk flask connected to a bubbler filled with mineral oil. The bubbler allows the release of hydrogen gas and excludes air from the reaction system. Substrate ( 0.2 mmol ), catalyst ( $2.0 \mathrm{~mol} \%$ ), $2 \times 50 \mathrm{~W}$ blue LEDs ( 455 nm ) lamps, dry and deoxygenated methanol ( 2 mL ) and room temperature for the appropriate time. Yield and conversion were determined by GC analysis using hexadecane as internal standard. Isolated yields were determined by solvent evaporation and analysis by ${ }^{1} \mathrm{H}$ NMR spectroscopy.

Figure S10 Photoreactor system (left) and emission spectra of Blue LED lamps (right).

## SUPPORTING INFORMATION

## S3.1 Reaction progress profiles

Figure S11 Photocatalytic dehydrogenation of $\mathbf{4 H}$. Reaction conditions: substrate ( 0.2 mmol ), catalyst II ( $2.0 \mathrm{~mol} \%$ ), methanol ( 2 mL ), blue LEDs ( 455 nm ) at room temperature. Reaction yield (product formation, 4D) obtained by GC/FID.

Figure S12 Photocatalytic dehydrogenation of $\mathbf{5 H}$. Reaction conditions: substrate ( 0.2 mmol ), catalyst II ( $2.0 \mathrm{~mol} \%$ ), methanol ( 2 mL ), blue LEDs $(455 \mathrm{~nm}$ ) at room temperature. Reaction yield (product formation, 5D) obtained by GC/FID.

## S3. $2{ }^{1} \mathrm{H}$ NMR spectroscopy analysis in photodehydrogenation reactions

Selectivity in photodehydrogenation of N -heterocycles was evaluated by ${ }^{1} \mathrm{H}$ NMR spectroscopy. After 18 h of reaction, the methanol solvent was evaporated, and the remaining mixture was directly analyzed by ${ }^{1} \mathrm{H}$ NMR spectroscopy in $\mathrm{CDCl}_{3}$ without any further purification.

Figure S13 Photodehydrogenation of $\mathbf{2 H}$. ${ }^{1} \mathrm{H}$ NMR spectrum at $\mathrm{t}=0 \mathrm{~h}$ and $\mathrm{t}=18 \mathrm{~h}$ reaction using hexadecane (signals at 1.26 and 0.88 ppm ) as an internal standard. Residual $\mathrm{CDCl}_{3}$ solvent signal at 7.26 ppm.

## S3.3 Photodehydrogenation reactions using Ir-H complex IX as catalyst

Table S2 Photodehydrogenation of N -heterocycles using Ir-H complex IX.

Entry

Reaction conditions: substrate ( 0.2 mmol ), Ir-H catalysts ( $2.0 \mathrm{~mol} \%$ ), methanol ( 2 mL ) and blue LEDs (455 nm). a) Yield obtained by GC/FID using hexadecane as an internal standard. b) Reaction under dark conditions.

## S4 Detection of molecular hydrogen

In a 12 mL Schlenk flask the stopcock valve was connected to a bubbler filled with mineral oil to exclude air from the reaction system and allowing the release of hydrogen gas and the flask was capped with a septum rubber. This septum rubber was used to introduce a syringe to capture the generated gas. Substrate ( 0.2 mmol ), catalyst ( $2.0 \mathrm{~mol} \%$ ), blue LEDs ( 455 nm ), dry/deoxygenated methanol ( 2 mL ) and room temperature. After 5 h reaction, the gas evolved was collected with a syringe and injected in a quadrupole mass spectrometer with a TCI detector (Omnistar GSD 32003 from PFEIFFER VACUUM) confirming the presence of molecular hydrogen. The same experiment was repeated in the absence of catalyst as control.

Figure S18 Detection of molecular hydrogen in the photodehydrogenation of $\mathbf{5 H}$ using catalyst II (green line) and control experiment without catalyst (red line).

## S5 DFT Calculations and Spectroscopic studies

Geometry optimizations, single-point calculations, frequency calculations and time-dependent calculations (TD-DFT) were performed using Gaussian 09 suite of programs with the PBE1PBE functional and the LanL2DZ basis for Ir and 6-31G(d) for (C H N O). ${ }^{12}$ Frequency calculations were performed on optimized geometries to ensure true minima.

## S6 Thermal dehydrogenation of $\mathbf{N}$-heterocycles

Catalytic experiments were performed in a 25 mL Schenk flask connected to a condenser containing a bubbler filled with mineral oil to exclude air from the reaction system and to allow the release of molecular hydrogen.

Table S9 Thermal dehydrogenation of N -heterocycles under various reaction conditions.

Reaction conditions: substrate ( 0.5 mmol ), catalyst, solvent for 18 h . Product formation (yield) obtained by GC/FID using hexadecane as an internal standard. [a] Reaction without catalyst. [b] Reaction carried out in a closed system.

## S7 Experimental evidence of hydride formation

Under inert atmosphere, an NMR tube with a Teflon-lined cap was charged with 5 mg ( 0.0053 mmol ) of catalyst II, deoxygenated methanol-d4 ( 1 mL ) and $5 \mu \mathrm{~L}(0.04 \mathrm{mmol})$ of 1,2,3,4-tetrahydroquinoline (THQ). Reaction mixture was irradiated at room temperature, with blue LEDs ( $\lambda 455 \mathrm{~nm}$ ) for 3 h and monitored by ${ }^{1} \mathrm{H}$ NMR in a closed system.
${ }^{1} \mathrm{H}$ NMR spectra at selected times ( 0 and 3 h ) show the evolution of 1,2,3,4-tetrahydroquinoline in presence of catalyst II under inert conditions (Figure S26). After irradiation with blue LED light, a new signal appears at -14.23 ppm , typical of hydride species. In addition, it is also characteristic the disappearance the $\mathrm{Cp}^{*}$ signal of complex II at 1.13 ppm , while the appearance of a new $\mathrm{Cp}^{*}$ signal of Ir - H complex at 1.35 ppm (highlighted in blue). Both remarks confirm the presence of a hydride complex as intermediate during the catalytic transformation as resting state.

Figure S26 ${ }^{1} \mathrm{H}$ NMR spectra showing the formation of an Ir-H in the photocatalytic reaction of THW in the presence of complex II using methanol-d4 (residual solvent signal 4.70 ppm ). Highlighted signals:

Cp * group (blue) and 1,2,3,4-tetrahydroquinoline (green)

## SUPPORTING INFORMATION

## S8 Experimental evidence of dehydrogenation sequence in N -heterocycles induced by visible light

The double photodehydrogenation of N -heterocycles in THQs may happen at the $\mathrm{NH}-\mathrm{C}(2) \mathrm{H}$ (imine intermediate) or at the $\mathrm{C}(3) \mathrm{H}-\mathrm{C}(4) \mathrm{H}$ remote position. In order to stablish the dehydrogenation sequence, we used a model compound where dehydrogenation next to N is blocked and analyzed the possibility of direct dehydrogenation at $\mathrm{C}(3) \mathrm{H}-\mathrm{C}(4) \mathrm{H}$. Using catalysts II under 18 h irradiation, we have observed that dehydrogenation of $\mathrm{C}(3) \mathrm{H}-\mathrm{C}(4) \mathrm{H}$ does not occur. This result suggests that dehydrogenation sequence in N -heterocycles is produced via a first dehydrogenation next to N , tautomerization and second dehydrogenation.

Figure S27 Photodehydrogenation of 1,2,3,4-tetrahydro-2,2,4,7-tetramethylquinoline.

Figure S28 ${ }^{1} \mathrm{H}$ NMR spectra in photodehydrogenation of 1,2,3,4-tetrahydro-2,2,4,7tetramethylquinoline in methanol-d4 (residual solvent signals at 4.70 and 3.35 ppm ) at $\mathrm{t}=0 \mathrm{~h}$ (a) and after $\mathrm{t}=18 \mathrm{~h}(\mathrm{~b})$.

Figure S29 Proposed double dehydrogenation sequence of N -heterocycles.

## S9 Complete mechanistic proposal

Figure S30 Complete mechanistic proposal showing photodehydrogenation and hydrogenation pathways.

## SUPPORTING INFORMATION

## S10 Hydrogenation of N -heterocycles

All high-pressure catalyzed hydrogenation reactions were carried out in a 100 mL stain steel autoclave. Catalytic reactions were carried out in 2 mL GC glass vials, which were set in an alloy plate and placed inside the autoclave. The autoclave was purged with 10 bar of hydrogen for three times before setting the pressure to the desired value. Each GC glass vial was loaded with the corresponding substrate ( 0.2 mmol ), catalyst ( $1 \mathrm{~mol} \%$ ) and dry/deoxygenated toluene ( 1 mL ). The autoclave was loaded with 2.5 bar of $\mathrm{H}_{2}$, sealed and heated using a hot plate at $80^{\circ} \mathrm{C}$ for 6 h . Conversions and yields were determined by GC relative to hexadecane as internal standard and by ${ }^{1} \mathrm{H}$ NMR spectroscopy.

Figure S31 Hydrogenation of 1D. ${ }^{1} \mathrm{H}$ NMR spectrum at $t=0 \mathrm{~h}$ and $\mathrm{t}=6 \mathrm{~h}$ reaction using hexadecane (signals at 1.26 and 0.88 ppm ) as an internal standard. Residual $\mathrm{CDCl}_{3}$ solvent signal at 7.26 ppm .
